

UML Class Diagrams

DS 501 Database Systems Prof. Chandrashekar

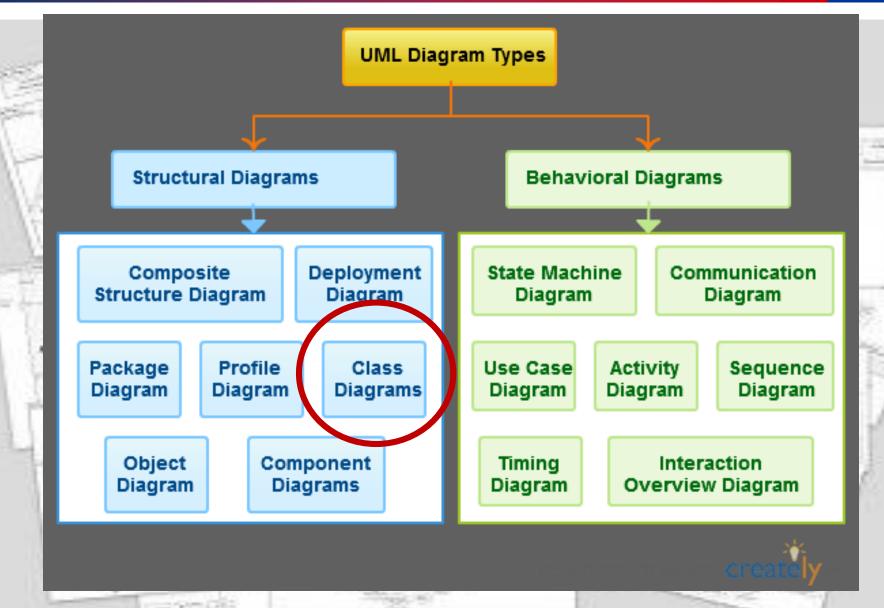

Outline

- Using UML for database design
- UML notations

UML Components

Elements of Class Diagram

- Class
- Attribute
- Relationships
 - Association
 - Aggregation
 - Composition
 - Inheritance

Class and attributes

Course

Course_name
Class_room
Course_credits

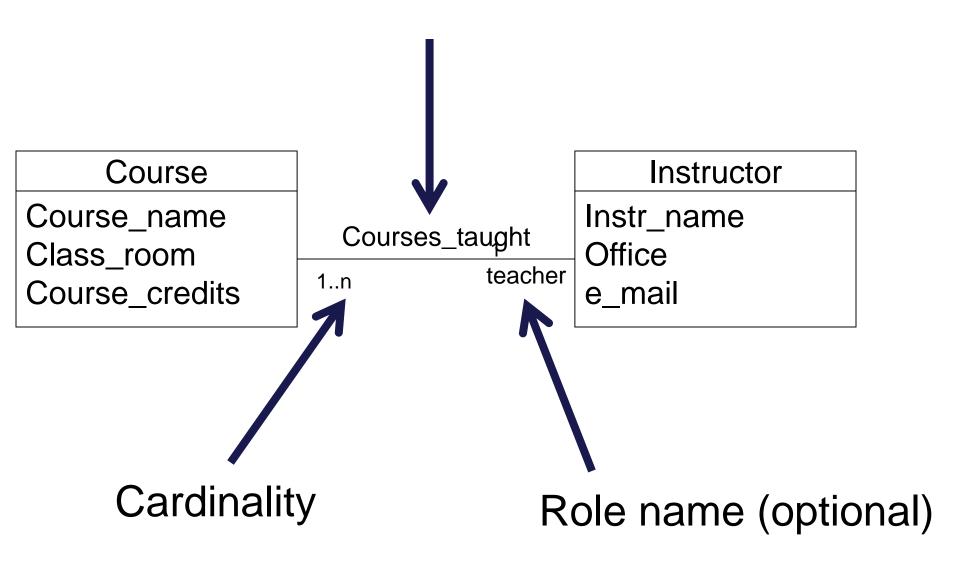

- Generally no methods in conceptual database designs
- Data types may be added as part of refinement

Association

Association name

Association cardinality

One:One

One:Many

Many:Many

What is the interpretation of cardinalities?

Aggregation (HAS-A)

Computer has-a peripheral

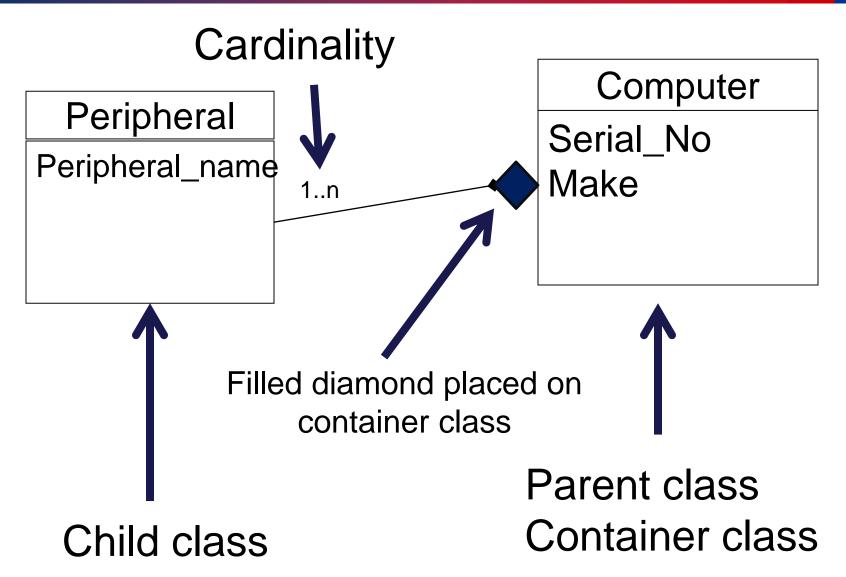

Aggregation (HAS-A)

- Aggregation is similar to association
- The association name is fixed to "HAS-A"
- Cardinality cannot be "many:many"
- Child can exist independently until attached to a parent

Composition (IS-PART-OF)

Peripheral is-part-of computer

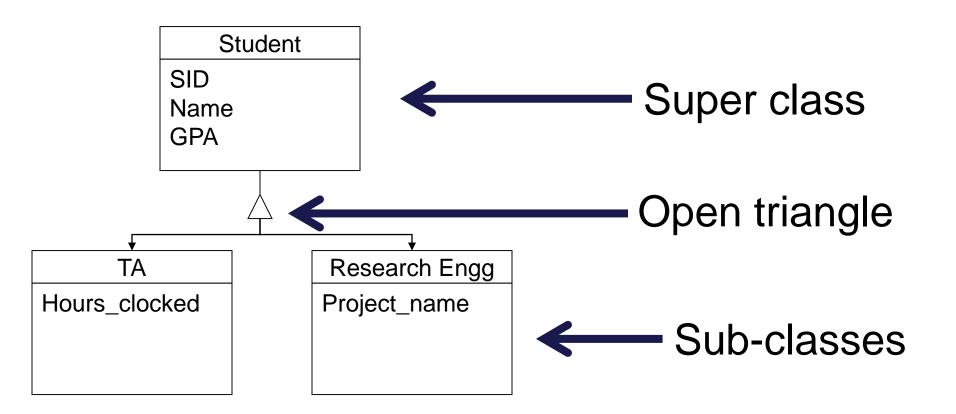

Composition (IS-PART-OF)

- Aggregation is similar to composition
- The relationship name is fixed to "IS-PART-OF"
- Cardinality cannot be "many:many"
- Child CANNOT exist independently until attached to a parent ("existence dependency")
- Deletion semantics All child objects get deleted when parent is deleted

Inheritance (IS-A)

A student can be either a TA or research engineer or neither

Inheritance (IS-A)

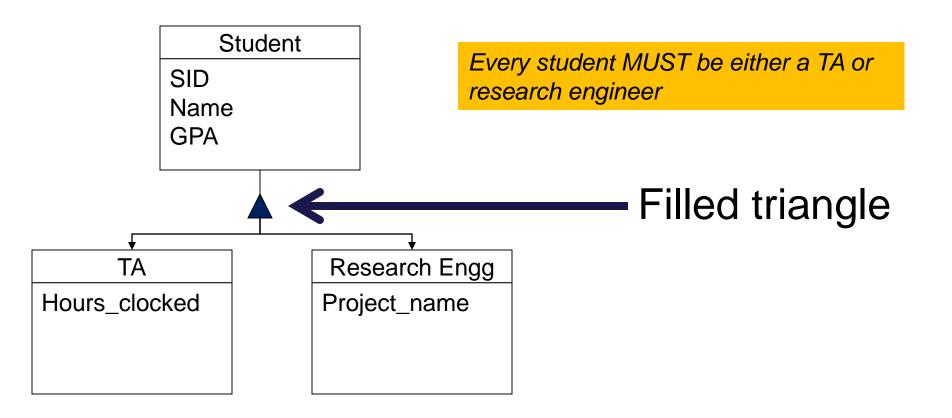

- The relationship name is fixed to "IS-A"
- Child object inherits all attributes of parent objects
- Class hierarchy can be arbitrarily deep
- Cardinality
 - cannot be "one:many"
 - cannot be "many:many"
 - Cardinality can only be 1:1 or 1:0
 - So no need to (and must not) mention cardinality

Partitioned subclasses

 Parent object cannot exist standalone

Describe this in 100 words!
